

ABSTRACT

A collapsible, disposable beverage container 10 holds an insulating sleeve 12 that carries a collapsible bag 14 for holding hot fluid. The container 10 is made of paperboard. Preferred materials for the collapsible bag are nylon and metalized flexible materials. The entire structure 10 is formed from a single sheet of paperboard 10 that is suitably scored, cut, bent and folded to a hex-shaped structure. The structure 10 includes seven panels 20-26 that form a six sided hexagonal structure. The two longest panels 23-24 overlap. The container has a top 30 that is integral with one of the longest panels and has a central opening. The bottom flaps are either interlocked with each other, glued to each other, or held together by tongue tags that extend from 15 the end panels into receiving slots in one or both end flaps.
